

ABSTRACT OF THE DISCLOSURE

A system for providing access to a network is provided. The system includes a management interface system that receives management data from one or more management systems, where each management system provides a type of management data for the network, such as device status data, event data, device performance monitoring data, or other suitable data. A portal system connected to the management interface system receives the management data and presents the management data in a predetermined format, such as in one or more view windows, such that management data from incompatible management systems can be presented in a single user-viewable display.
